15265, 15266 and 15267

Regolith Breccia

314.1, 271.4 and 1.8 grams

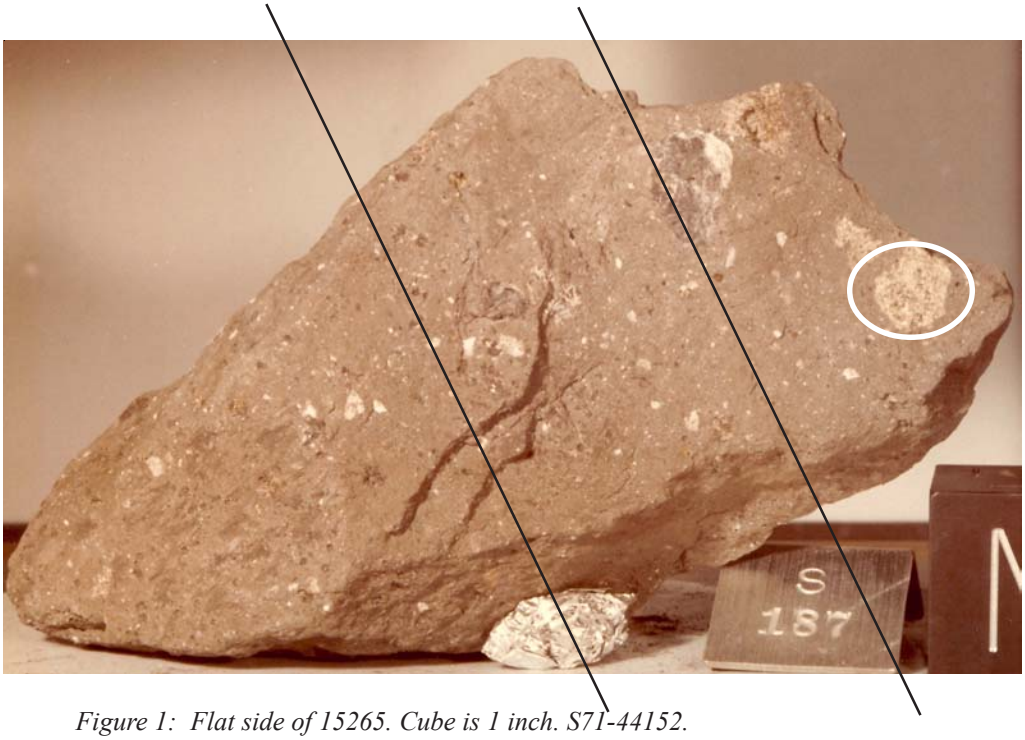

Figure 1: Flat side of 15265. Cube is 1 inch. S71-44152.

Figure 2: Two sides of 15266 showing two clasts. Sample is about 5 cm across. S71-44170 and 44172.

Introduction

These similar-looking breccia samples were returned in the same bag and are from the same small boulder, broken by the astronauts (figure 5). They are coherent regolith breccias with dark glassy matrix. A mare basalt clast was dated at 3.16 b.y.

Petrography

Fruland (1983) and Simon et al. (1986) included 15265 in the suite of Regolith Breccias. McKay et al. (1989) reported that the maturity index for 15265 was I_s/FeO = 21 and 14 for 15266. Grain size distribution was determined by freeze-dry-cycled disaggregation (Graf ,figure 11).

Figure 3: Location of 15265. AS15-85-11511

15265, 15266 and 15267 are coherent breccias containing mare basalt and KREEP basalt clasts as well as abundant glass. McKay et al. (1989) reported agglutinate fragments. Thin section photomicrographs can be found in the catalog by Ryder (1985).

Significant Clast

Basalt Clast

Mark et al. (1974) determined the age of a mare basalt clast.

Chemistry

LSPET (1972), Keith et al. (1972), Simon et al. (1986), McKay et al. (1989) and determined the composition of 15265 and 15266 (figures 8 and 9).

Moore et al. (1973) determined 57 ppm carbon for 15265 (figure 10). Kaplan et al. (1976) reported 76 ppm carbon, 41 ppn nitrogen and 870 ppm sulfur (including isotopic analysis).

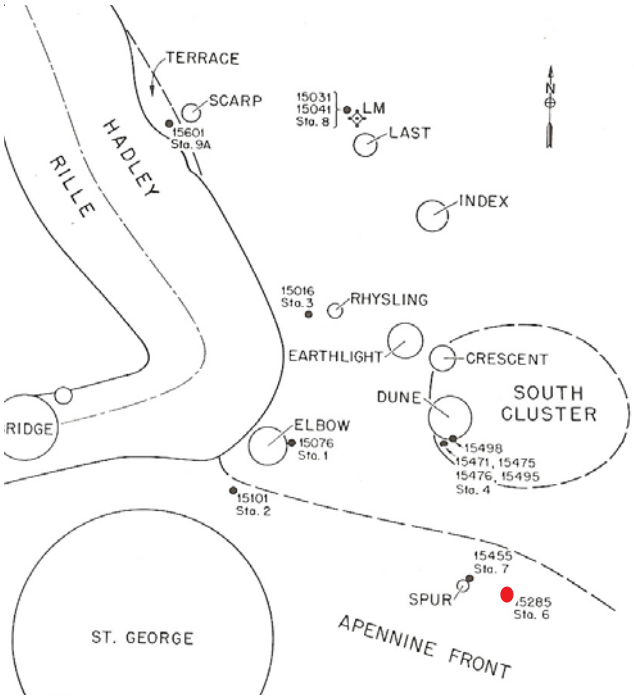

Figure 4: Location of 15265, 15266.

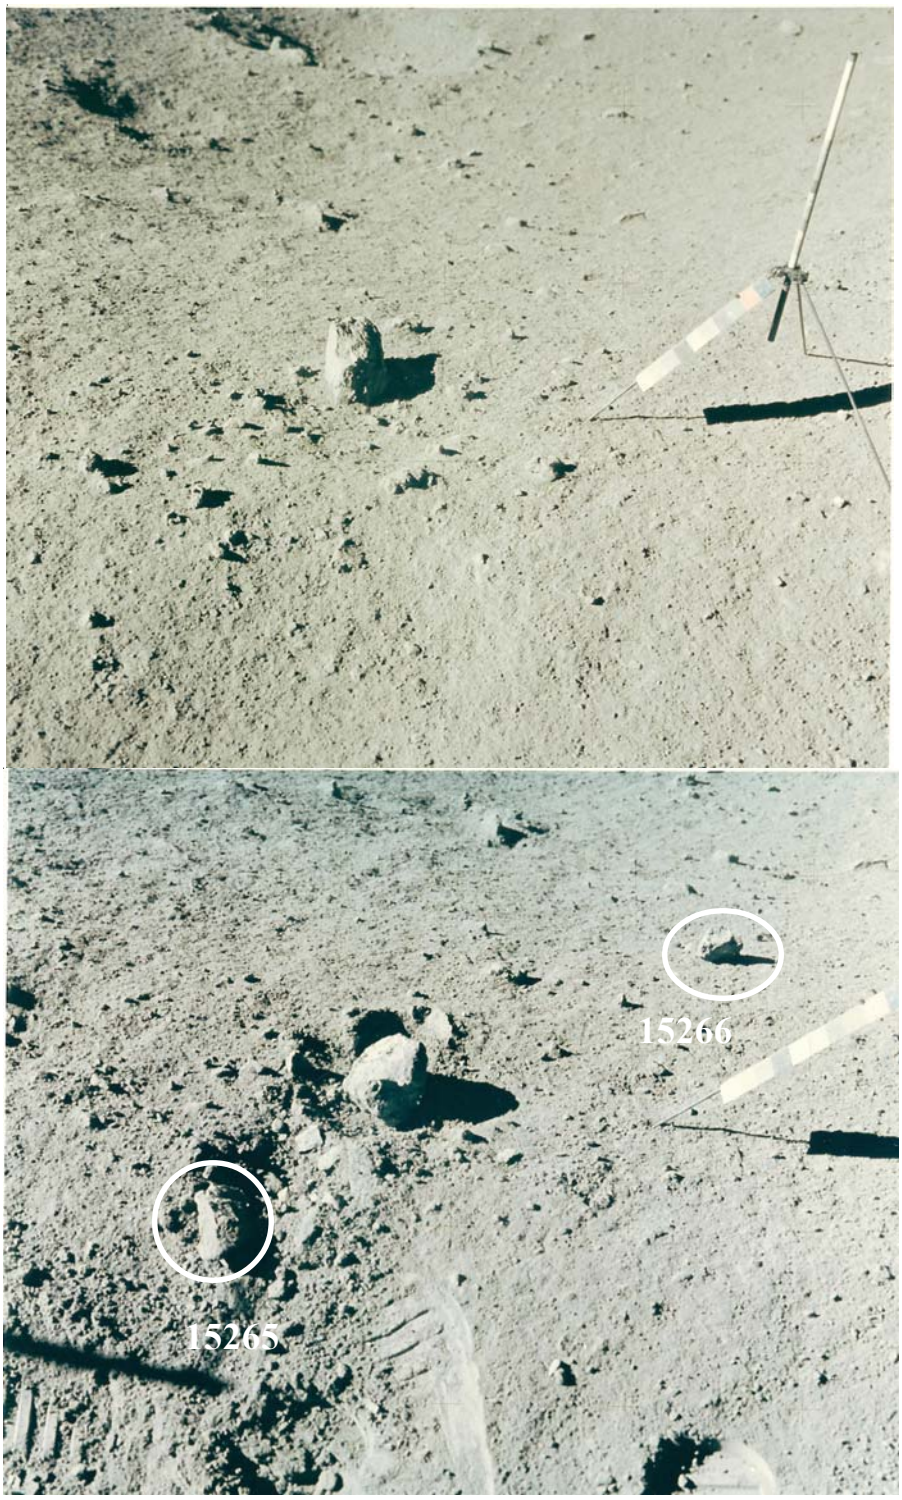

Figure 5: Before and after photos of small rock, broken by astronauts to yield 15265 and 15266. AS1586-11635 and 639. Gnomon is 50 cm.

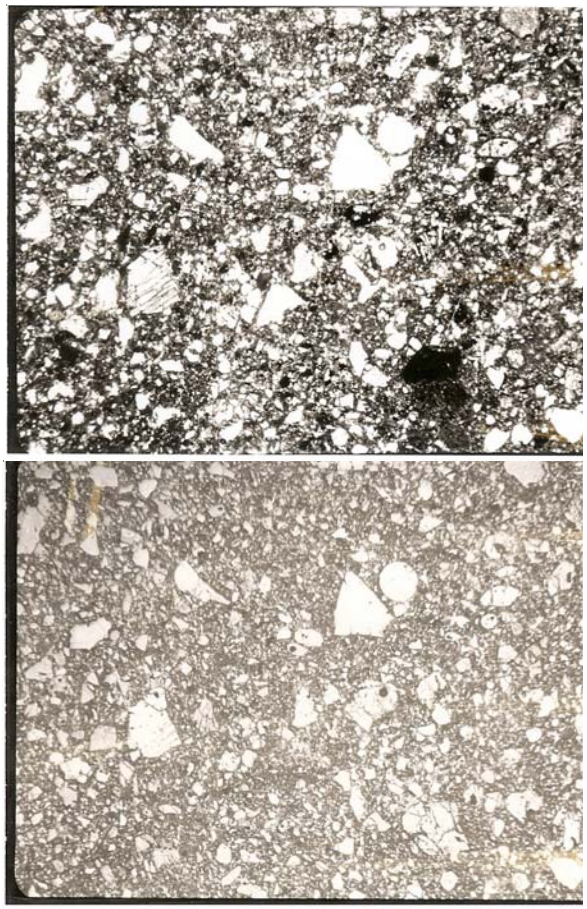

Figure 6 a,b: Transmitted and reflected light photomicrographs of thin section of 15265. Field of view is 2 mm.

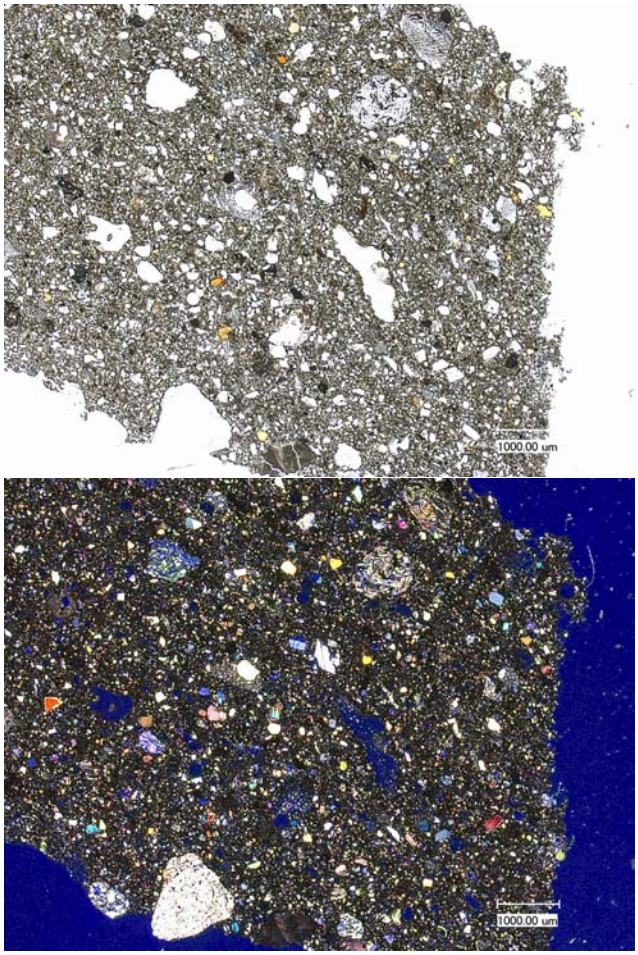

Figure 7a,b: Photomicrographs of 15265,74 by C Meyer. Scale bar is 1 mm.

Mode for 15265 *(Simon et al. 1986)*

Matrix	<20 micron	61.6 %
	20-90 micron	90-1000 micron
Mare basalt	1.3	1.9
Plutonic Rx.	0.1	0.8
Feld. CMB		0.6

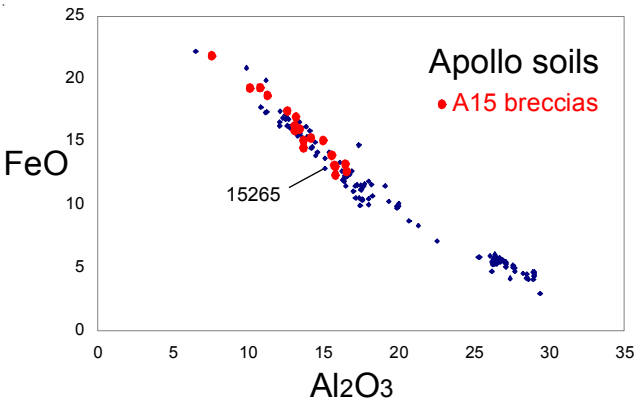

Figure 8: Compostion of Apollo soils, Apollo 15 breccias and 15265.

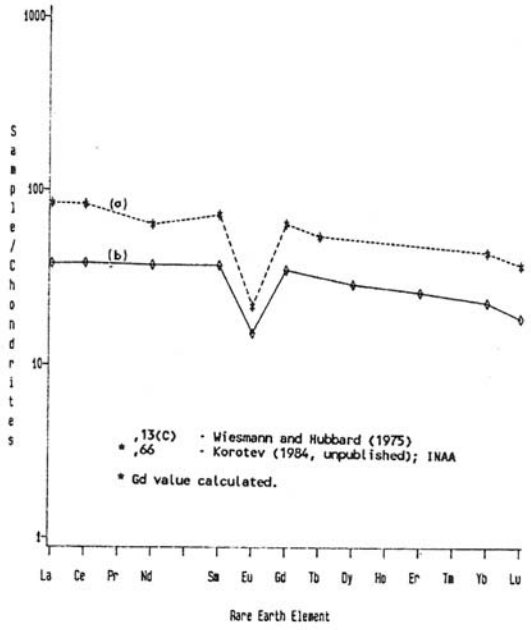

Figure 9: Normalized rare-earth-element diagram for 15265 (see table).

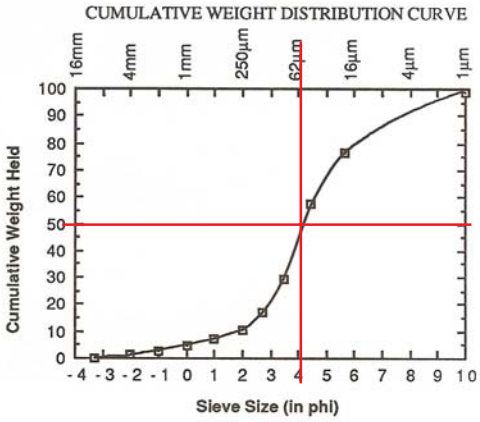

Average Grain Size = 44 microns

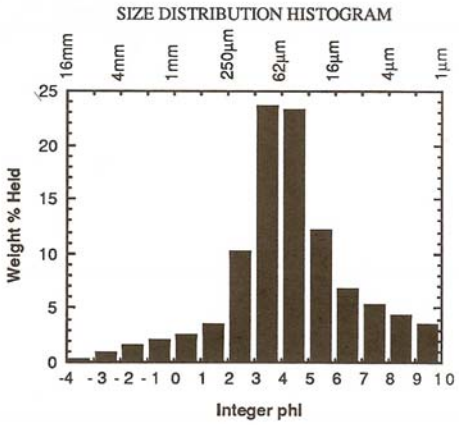

Figure 11: Grain size distribution for 15265 after freeze-thaw-cycle dissagregation (Graf 1987).

Radiogenic age dating

The only age date is by Mark et al. (1974) who determined the age of a mare basalt clast (figure 12).

Cosmogenic isotopes and exposure ages

Keith et al. (1972) determined the cosmic-ray-induced activity of ^{26}Al = 72 dpm/kg, ^{22}Na = 37 dpm/kg, ^{54}Mn = 12 dpm/kg, and ^{56}Co = 8 dpm/kg.

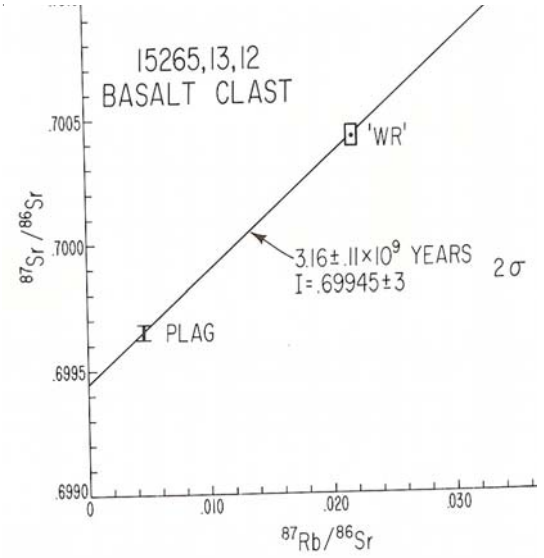

Figure 12: Rb/Sr isochron diagram for mare basalt clast from 15265 (Mark et al. 1974).

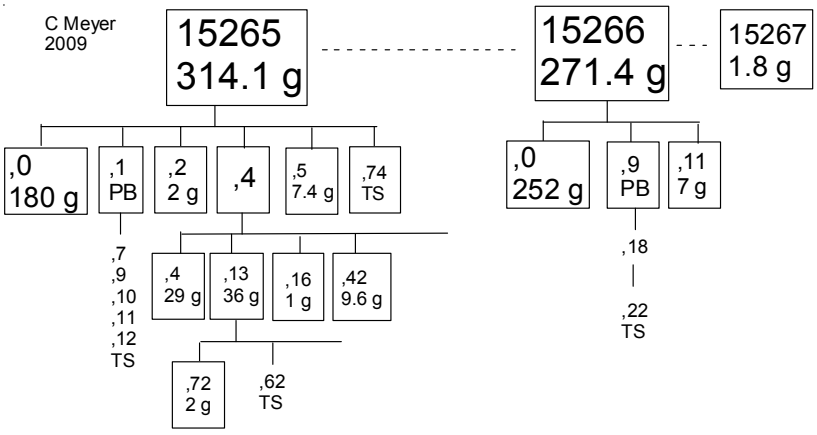
Figure 13: Photo of 15265,4. About 4 cm across. S75-33762.

Summary of Age Data for clast in 15265

	Rb/Sr
Mark et al. 1974	3.16 ± 0.11 b.y.



Other Studies

Rare gas concentrations and isotopic ratios were reported by McKay et al. (1989) and Bogard and Nyquist (1973).

Bhandari et al. (1973) studied the distribution of cosmic ray tracks

Processing

15265 was originally issued to the Burlingame Consortium. There are 6 thin section of 15265 and 5 for 15266. These samples have not been sawn.

Table 1. Chemical composition of 15265.
